Feedback

Recaptcha (security question) is optional. It uses Google's Recaptcha service. Recaptcha service works per domain. So, to make it properly work, you should create your own private and public keys for your domain on <https://www.google.com/recaptcha> and replace keys in **appsettings.json** file under the ***.Web.Host** project and in the **appconfig.json** in the client side.

Each tenant can enable/disable user registration under the "User management" tab of settings page. If user registration is disabled for a tenant, "Create Account" link will not be visible on the login page for that
