Edit
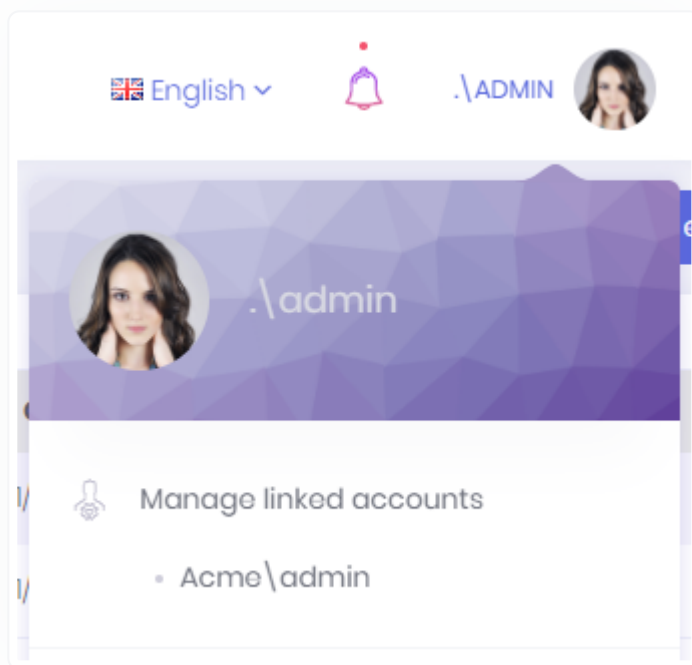

User Menu

A user can click his name at top right corner to open user menu:

Linked Accounts

Linked accounts are used to link multiple accounts to each other. In this way, a user can easily navigate through his accounts using this feature.

User can link new accounts or delete already linked accounts by clicking the **Manage accounts** link.

Change Password

User can change the password using this option. **ProfileAppService** is used to change password.

All login attempts (succeed of failed) are logged in the application. A user can see last login attempts for his/her account.

Login attempts ✕

🔗 Change Picture

A user can change his/her own profile picture. Currently JPG, JPEG, GIF and PNG files are supported.

Change profile picture   ✕

☐   Use Gravatar profile picture

[Choose File] No file chosen   You can select a JPG/JPEG/PNG file with a maximum 5MB size.

Cancel   💾 Save

My Settings

My settings modal is used to change user profile settings:

As shown here, **admin** user name can not be changed. It's considered a special user name since it's used in database migration seed. Other users can change their usernames.
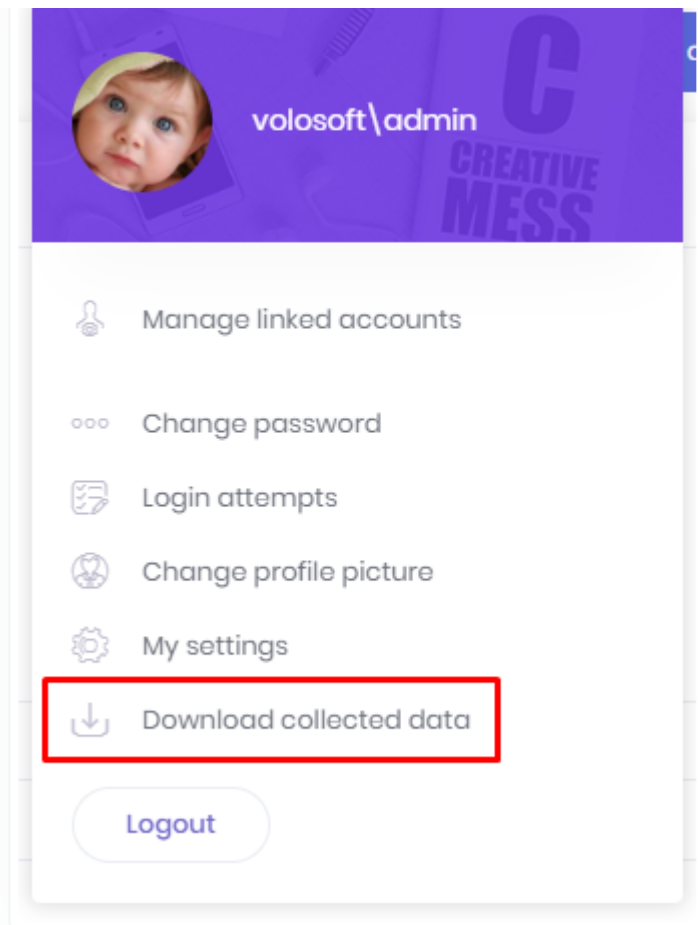

Users can also validate phone number on this page. If phone number validation is enabled, a "**Confirm**" button will be visible when user enters a phone number into the phone number textbox. When the confirm button is clicked, a confirmation code will be sent to user's phone number (if sms sending is implemented. You can use Twilio which is already integrated into ASP.NET Zero) and entering that code into the opened dialog will confirm user's phone number.

Download Collected Data

ASP.NET Zero includes an interface named **IUserCollectedDataProvider** and there are 3 different implementation for this interface.

- **ChatUserCollectedDataProvider.cs** creates an excel file with the chat conversations of the user.
- **ProfilePictureUserCollectedDataProvider.cs** creates a image file with the user's profile picture.
- **ProfileUserCollectedDataProvider.cs** creates a text file including user's profile information.

ASP.NET Zero compress those files into a new zip file and sends it to user as a notification so user can download his/her data.

If you create a new implementation of **IUserCollectedDataProvider** interface, ASP.NET Zero will automatically include your file into generated zip file as well.

Logout

TokenAuthController is used to logout the user. When the user clicks to **Logout** button, user's token is invalidated on the server side and removed from client side and the user is redirected to login page.
